## Advanced digital technology ?

### 1995 INTALOGIX Technology:

**Converter is separate component.**

**Analog load cells are isolated from power surges. “Instrument” is micro-processor only. The result is a high resolution, high accuracy, environmentally protected system !**

**Digital Signal**

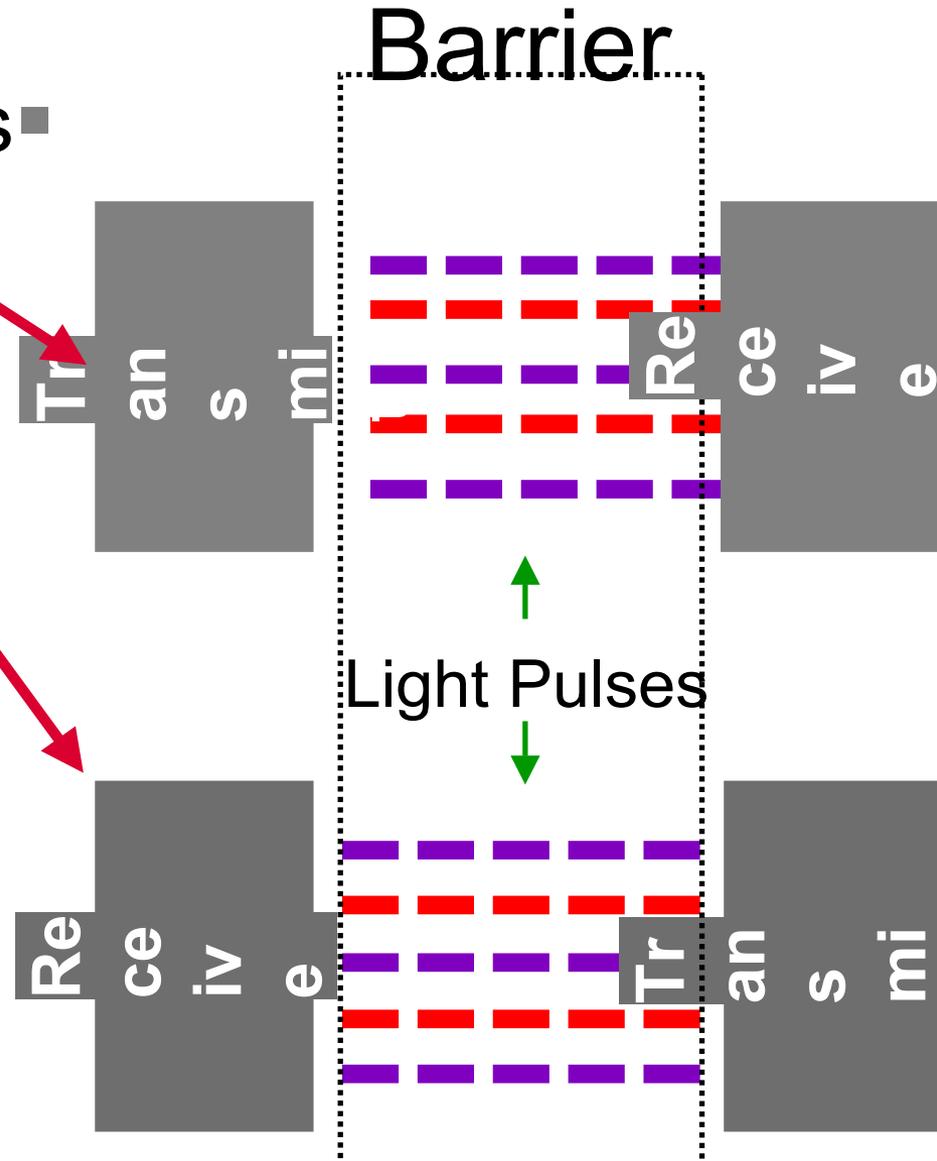

**Power - 30VAC**

**Environmental protection -**  
The cable from the indicator to the scale is optically connected on the signal side & transformer coupled on the power side for complete surge isolation.

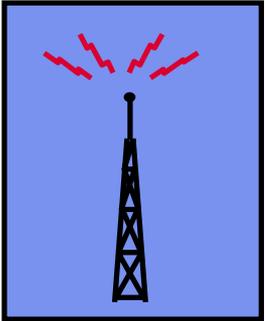

# Optic Isolation

Optic Isolators ■

- Transfers Electric Signal to Pulses of Light
- Provides Barrier Against Surges

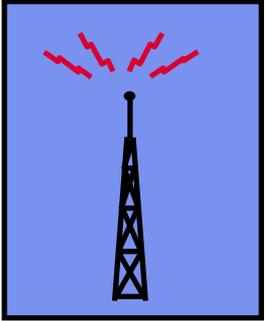

## Environmental Protection Benefits

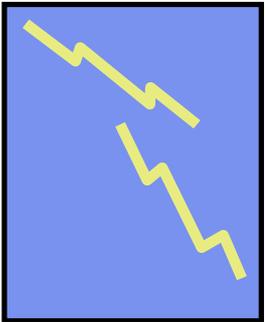

**RFI Immune** - Critical components in enclosures located under scale. Signal to indicator is high. Cable to & from scale is optically isolated.

## Environmental Protection Benefits

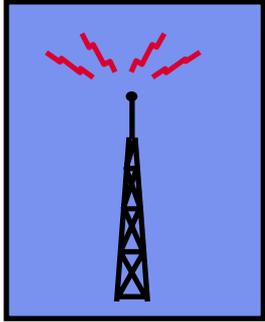

**RFI Immune** - Critical components in enclosures located under scale. Signal to indicator is high. Cable to & from scale is optically isolated.

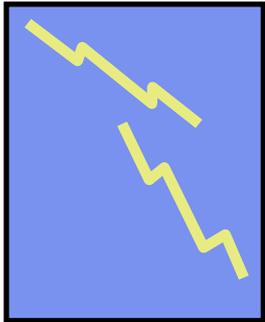

**Surge Voltage Protection** - The power supply and load cells are isolated providing Surge protection 8 times greater than previous technologies.

**Surge Voltage Protection** - The power supply and load cells are isolated providing Surge protection 8 times greater than previous technologies.

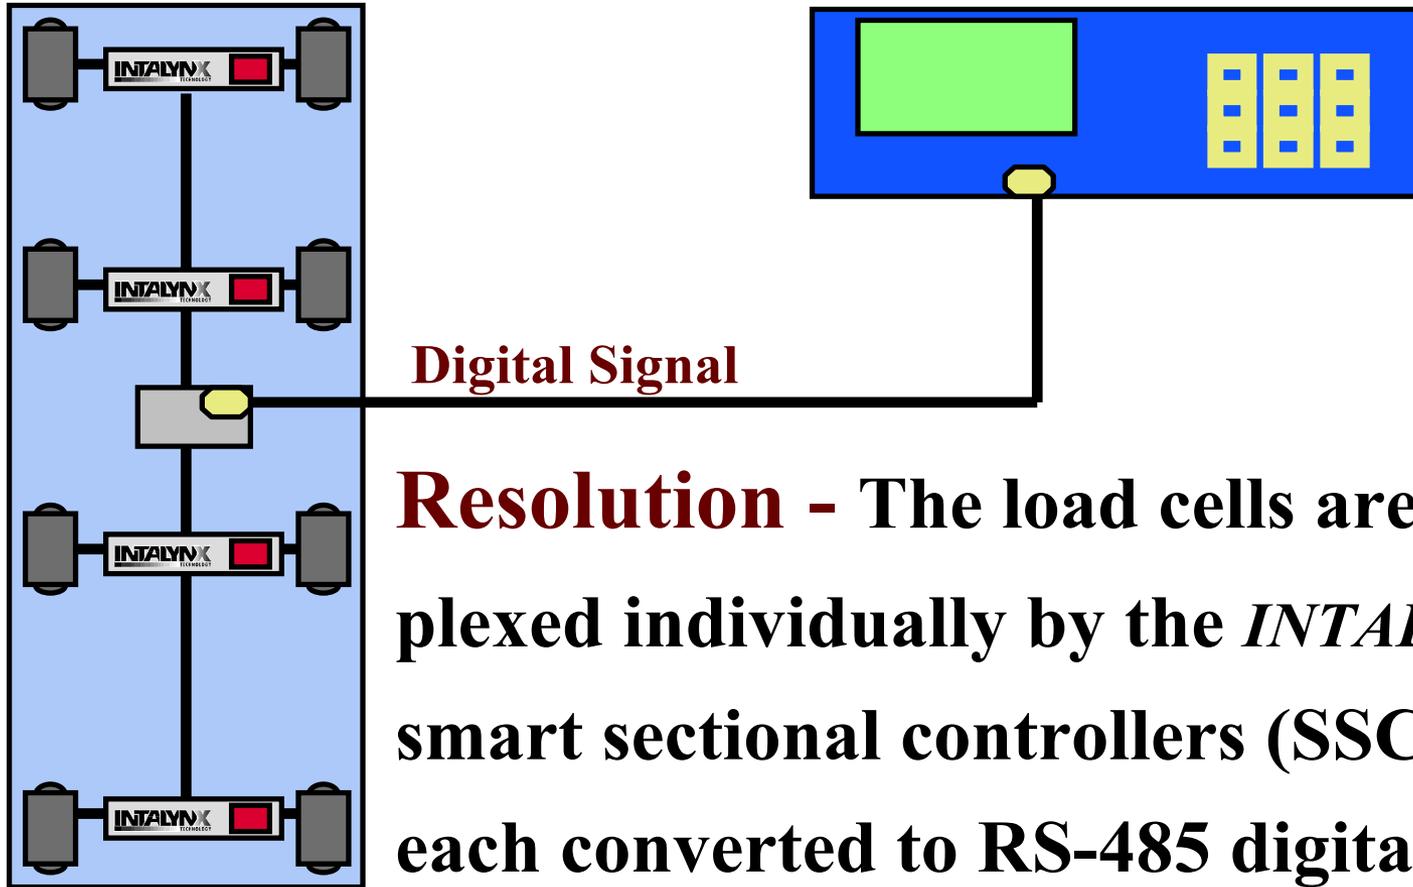

**Water Resistance** - Smart Sectional Controllers and Power Supply in NEMA 4X enclosures

**Resolution** - The act or process of separating or reducing something into its constituent parts.

**Resolution** - The load cells are multiplexed individually by the *INTALOGIX* smart sectional controllers (SSC) and each converted to RS-485 digital signal for processing by the instrument.

# Resolution:

**\*Each load cell independent**

**>Higher Signal Level**

**~Greater Stability**

**~Smaller Division Size \***

**>Simplified Diagnostics**

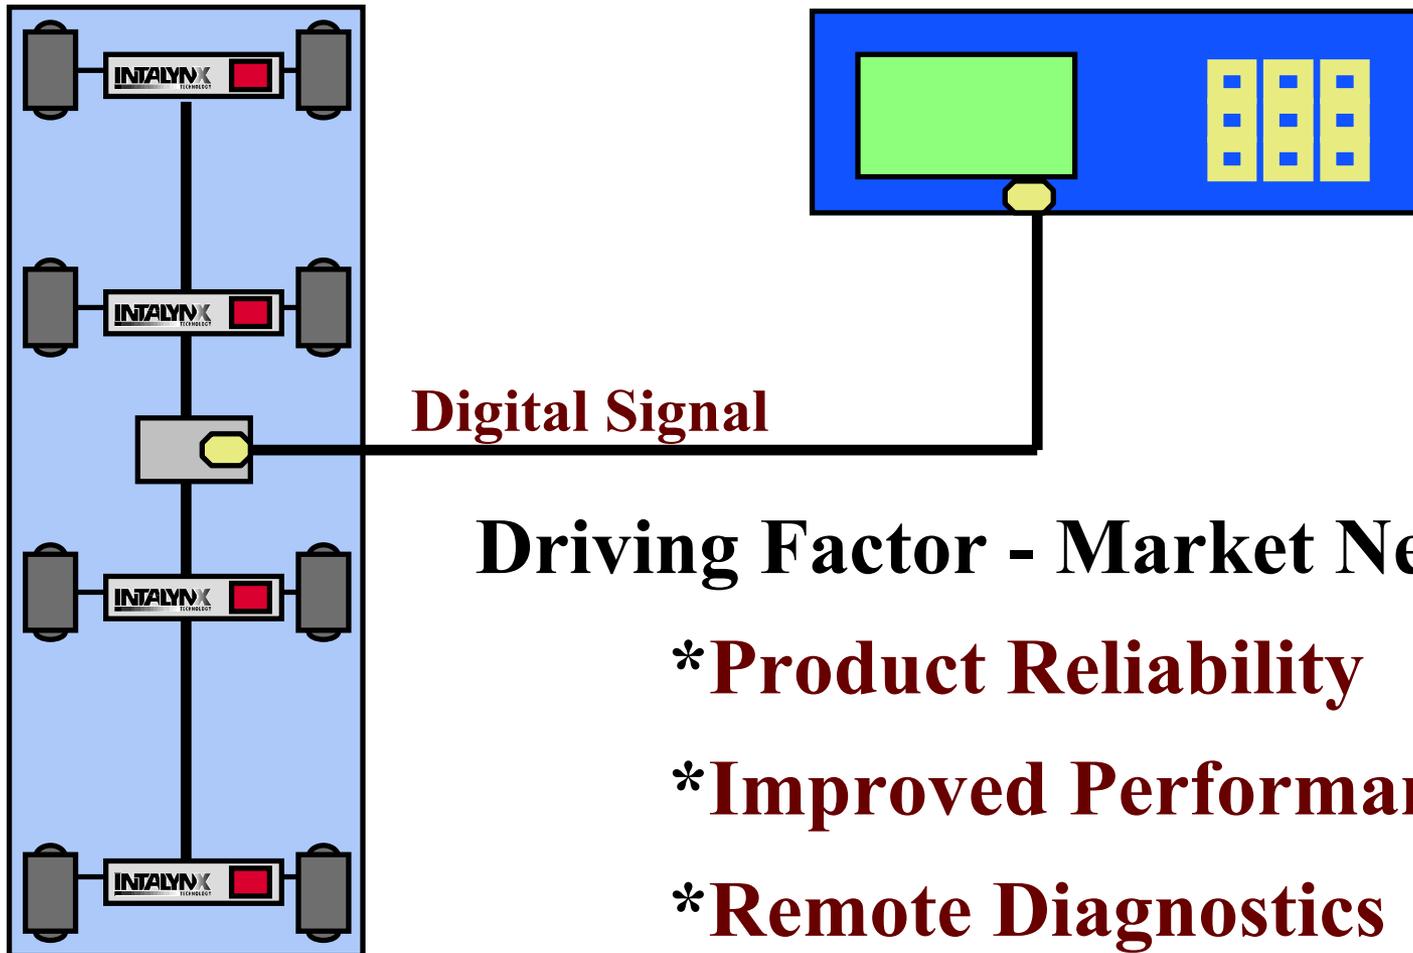

**~Track Load Cell Performance**

**>Precision Calibration**

**~Individual Cell Level**

**>Multiple Scale**

**~Independent of cell characteristics**

# Digital Technology

## FEATURES

■ Digital signal from scale to instrument

*f* Allows better resolution

*f* Increased accuracy

*f* Stronger Signal

–Analog = 30 to 45 mV at Capacity  
corresponding to the amount of weight on  
platform

–Digital (Intalogix) = 5 VDC Zero to Capacity  
regardless of weight

# Digital Technology

## Analog Comparison

■ Analog Technology - weak signal between instrument and platform

*f* 30 - 45 mV at capacity

Instrument provides 10 VDC excitation

**10 excitation**

Load cells have a 3mV/V rating

**x 3 mV/V**

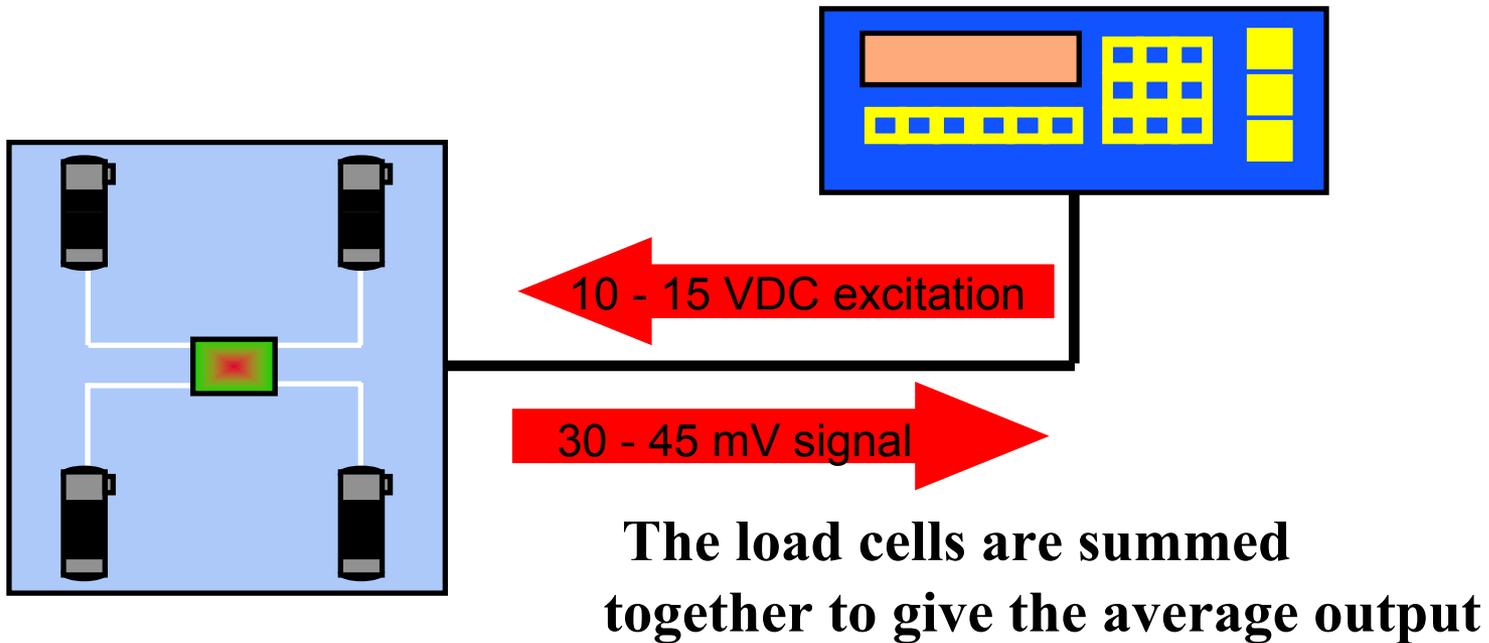

**30 mV at capacity**

### NOTE:

Some instruments use a 15 VDC excitation

This would result in a 45 mV signal at capacity

# Analog Technology

# Digital Technology

## Analog Comparison

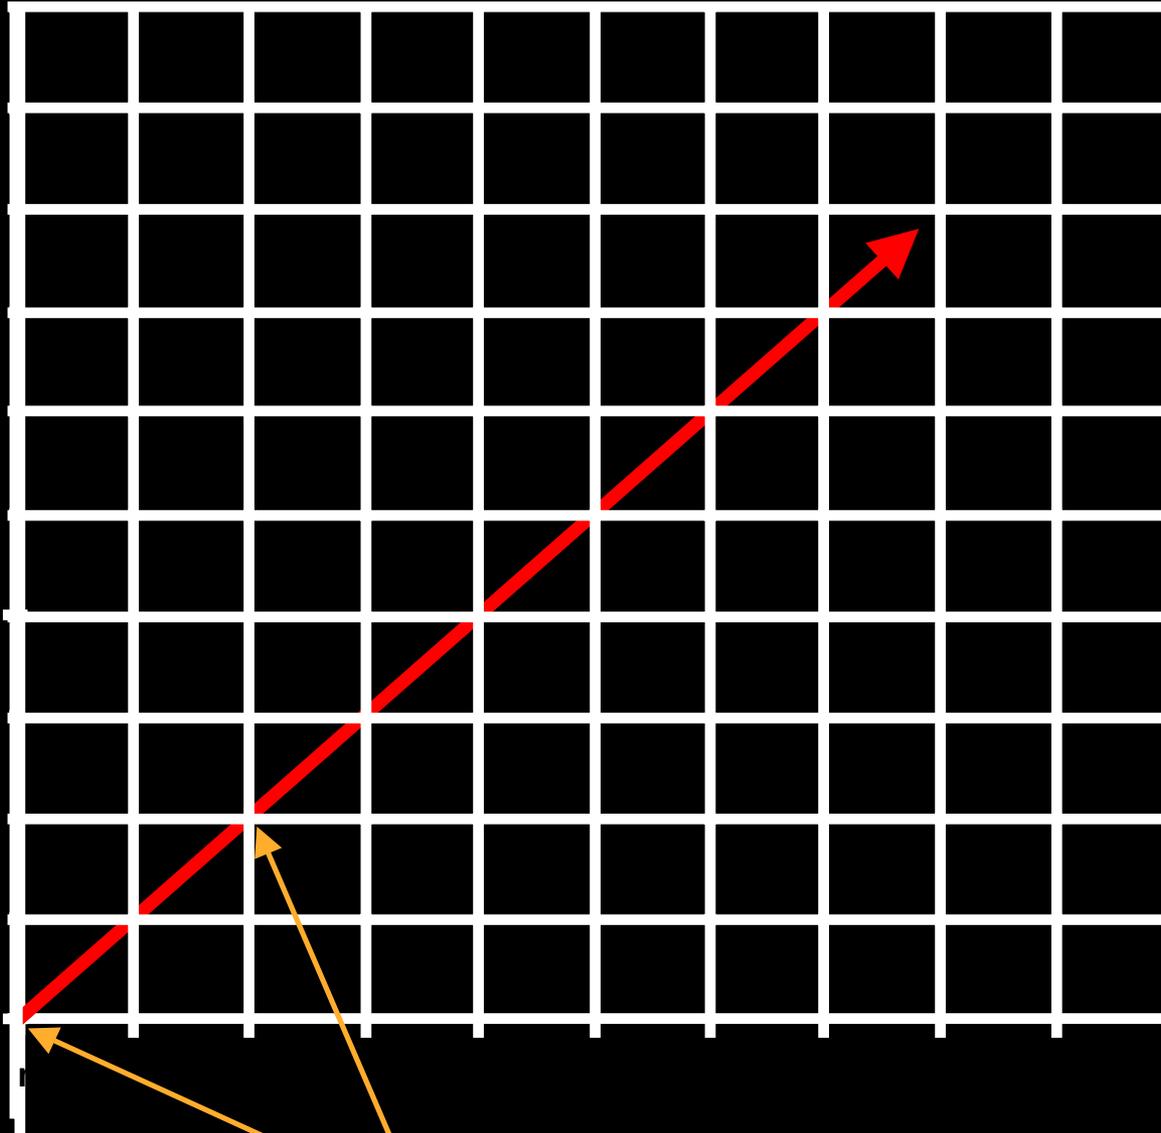

- What about at 'zero' weight or half capacity?  
*f* 30 - 45 mV at capacity
- First lets assume the scale is linear
- Meaning ... As weight is added, the signal should also increase proportionally

# Digital Technology

## Analog Comparison

- If the floor scale is at 'zero', the mV signal will be somewhere around 0 to 5 mV
- This is due to the weight of the platform itself setting on the load cells
- As weight is added, the signal will increase

# Sample Linearity Graph

Notice a 5 mV change for 200 lbs

# Digital Technology

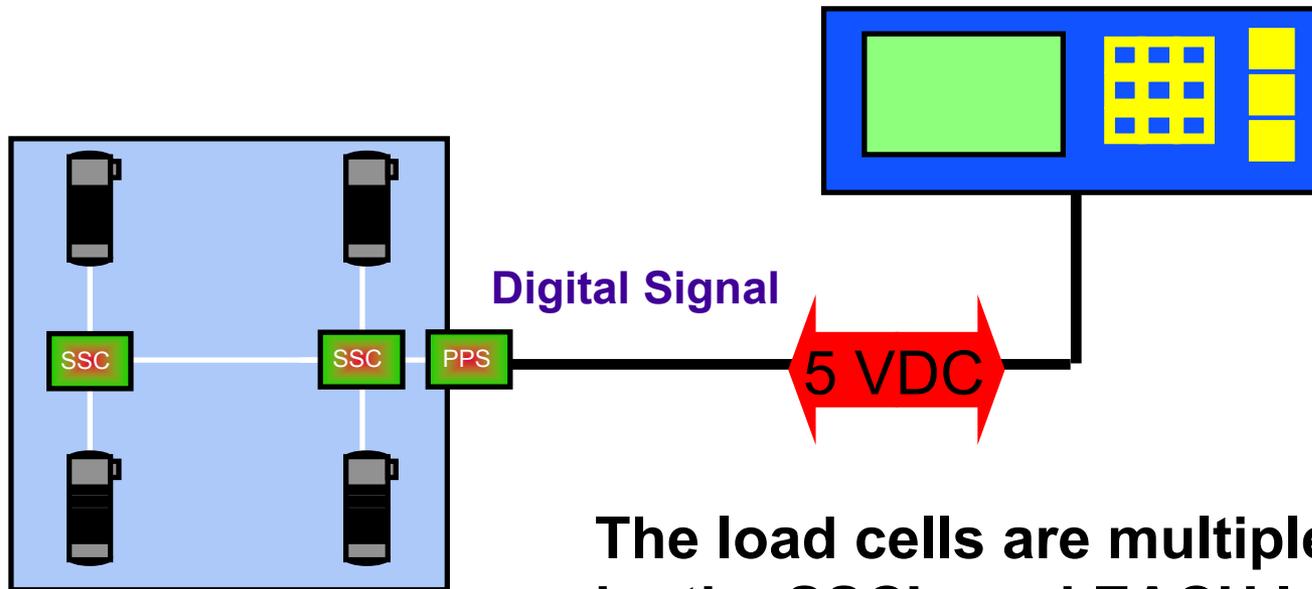

## Analog Comparison

- Lets break it down into the smallest parts
- $1000 \times 0.1$ 
  - Capacity = 1000 lbs
  - Division size = 0.1 lbs
  - Total divisions = 10,000
- When we add 200 lbs, the signal in our example increases 5 mV or 0.005 VDC
- 200 lbs in 0.1 steps is 2000 divisions
- $0.005 / 2000 = 0.0000025$  VDC for each 0.1 lb

# Digital Technology

- Lets look at how Intalogix Technology works
- Platform to instrument signal is a digital signal
- Signal strength does NOT vary as weight changes
- Signal is a digital RS 485
  - f* Strength is a 5 VDC differential
    - 5.0 digital
    - 0.0000025 analog

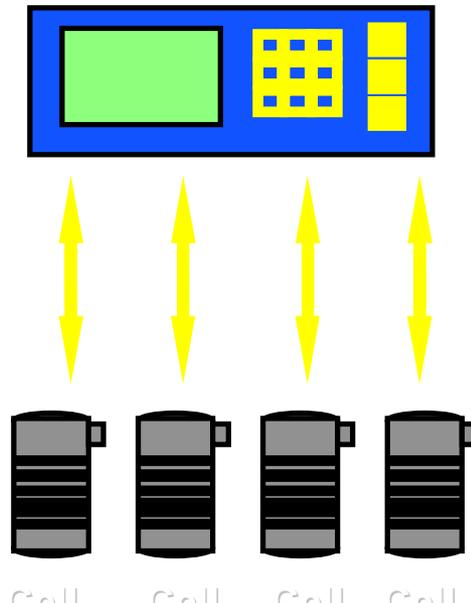

# Intalogix Technology

**The load cells are multiplexed by the SSC's and EACH load cell signal is processed by the instrument.**

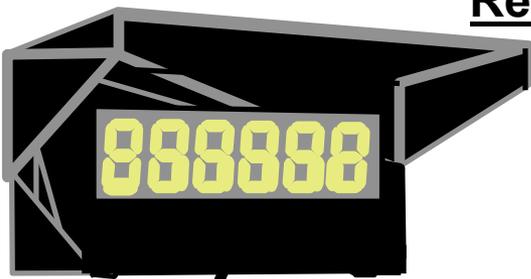

# Intalogix Technology

- Each cell is identified individually
- Instrument is constantly polling cells for data by ID
- Each cell is treated like its own scale
